

## REMOTE MANAGEMENT INTALLATION AGE44

### Description

The Facilities Remote Control is an application used to remotely control and manage fire protection facilities based on the algorithmic system centrals AE / SA-C1, AE / SA-C2, AE / SA-C8, AE / SA-C23H and AE / SA-C83H, analog system AE / 94-C2 and AE / 94-C8, and conventional system C5 for model AE / C5-8-16.

This allows us, among other things:

- Create and maintain a database of connections (groups of exchanges).
- Monitor the status of any connection defined in the database, showing the current status of each of its exchanges.
- Remotely control any monitored central, through a panel that represents the front of the central itself.

The connection between the Telecontrol program and the exchanges can be made through serial interfaces (RS-232, RS-485) or over TCP / IP.

The connection to the AE / C5-8-16 center can only be made over TCP / IP.
