REMOTE CONTROL OF THE INSTALLATIONS
AGE46

Description

The Remote Control of Installations is an application that allows remote control of fire protection installations based on Europe III control posts.

This allows us, among other things:
• Create and maintain a database of facilities, each managed by a checkpoint.
• Monitor the status of the facilities defined in the database, showing the real-time status of each of them.
• Remotely control any monitored installation, by means of a system that allows the control station computer to be operated as if it were in front of it.

The connection between the application and the remote installations is made using TCP / IP communications, which allows access to any installation that has this type of communications, regardless of its geographical location.
